

6

**INSERTI
INSETTI**

W5 - ISO P35/P40

La presente qualità trova particolare impiego nelle lavorazioni in cui sia richiesta una notevole tenacità, anche con taglio interrotto ed in condizioni sfavorevoli di utilizzo.

Lavorazioni di tornitura, fresatura di getti fusi in acciaio con crosta di fusione e con inclusioni sabbiose. Si impiega con eccellenti risultati anche per la lavorazione degli acciai inossidabili.

Bassa velocità di taglio e forti sezioni di truciolo.

KZ08 - ISO K10/K15

La presente qualità viene impiegata esclusivamente per la costruzione di inserti per la lavorazione di ghisa in genere, ottone, rame, alluminio, leghe leggere ecc. Possiede un'ottima resistenza all'usura, grazie alla particolare granulometria di dimensione inferiore al micron, ma scarsa tenacità. Si raccomanda per quei lavori dove non siano assolutamente coinvolti urti o vibrazioni che sicuramente danneggierebbero l'utensile. Tornitura, fresatura, foratura con minimi avanzamenti ad alta velocità di taglio.

Si impiega con ottimi risultati nella fresatura di ghise dure, particolarmente abrasive.

WH15 - ISO K20/K30

La tenacità di questo grado rispetto alla precedente qualità KZ08 è di gran lunga superiore, grazie alla maggior quantità di cobalto. Si impiega su macchine anche non rigide con minime vibrazioni ed urti, con velocità medie e sezioni di truciolo mediogrande.

La presente qualità viene anch'essa prodotta solo per la realizzazione di inserti per tornitura, foratura e fresatura. Si raccomanda questa qualità per lavorare ghise in genere, ottone, rame, alluminio, bronzo, legno, porcellana, ecc.

WX25 - ISO P20/P25/P35

Questa qualità corrisponde ai gradi della scala ISO P25-P30-P35 e ciò giustifica il fatto di essere una qualità molto versatile nel campo della fresatura, tornitura, foratura. Si impiega nelle lavorazioni di acciai non legati o poco legati, acciai al carbonio con bassa resistenza e facilmente lavorabili ecc., con medio-basse velocità di taglio e passate medio-forti. Si raccomanda per tutti quei lavori generici, con asportazione di truciolo di acciai in generale e ghise a truciolo lungo. Grazie alla sua buona tenacità la si può impiegare in lavori dove siano coinvolti leggeri urti e vibrazioni.

W5 - ISO P35/P40

This grade can be particularly used in workings that require an high toughness degree, even if with interrupted cutting and in unfavourable working conditions. Turning and milling works on molten steel casts with casting skin and sand inclusions.

It has also proved to be extremely successful in stainless steel working. Low cutting speed and strong chip section.

KZ08 - ISO K10/K15

The only field of application suitable for the above grade is represented by the manufacturing of inserts for cast iron working in general: brass, copper, aluminium, light alloys, etc.

Thanks to its particular grainsize, which is less than 1 micron thick, this quality is highly wear resistant but not very tough. It is therefore suggested for those works without any shocks or vibrations which would certainly damage the tool.

High speed turning, milling, drilling with minimum feed. Besides, it can be successfully used in the milling of particularly abrasive hard cast iron.

WH15 - ISO K20/K30

The toughness degree of this grade is much higher than the one of the previous KZ08 grade, thanks to its higher content of cobalt. It is used on machines subjected to no excessive shocks or unusual vibrations, with average speeds and mediuma-large chip section. This grade, too, is merely produced for turning, drilling and milling inserts. It is suitable for the working of cast iron in general, brass, copper, aluminium, bronze, wood, porcelain, etc.

WX25 - ISO P20/P25/P35

This type falls into the ISO P25/P30/P35 group and, for this reasons, it is an highly versatile grade as far as milling, turning and drilling are concerned. It is used for low-alloyed carbon steels characterized by low resistance and easy machinability with medium-low cutting speeds and medium-strong depths of cut. It is recommended for all generic works with chip removal of steels in general and long chip cast iron. Thanks to its good toughness, it can be suitably used in works involving light shocks and vibrations.

333X - ISO P20/P25/P30

Qualità rivestite con nitruri e carbonitriuri di titanio avente un sottostato opportunamente studiato per resistere alle alte temperature di esercizio.

Si colloca nel campo ISO P20/P25/P30 ed è adatta particolarmente per lavorazioni generiche di ogni tipo di acciaio sia al carbonio che legati.

Possiede ottima resistenza all'usura, dovuta al suo rivestimento di circa 6 micron di spessore, ma scarsa tenacità; si sconsiglia dunque l'impiego in quelle lavorazioni di tornitura o fresatura ove sussistono eccessivi urti e vibrazioni.

Il rivestimento si presenta di color giallo chiaro.

666X - ISO P35/P40/P45

Qualità rivestita di carburi e carbonitriuri di titanio avente un sottostato opportunamente studiato per resistere alle forti sollecitazioni di urti, vibrazioni, anche su macchine non moderne.

Si impiega con ottimi risultati nelle lavorazioni di tornitura generica di acciai ed in particolare e di inossidabili e ghise. Qualità veramente tuttofare in quanto il rivestimento di circa 6 micron garantisce ottima resistenza all'usura mentre il tenacissimo sottostato (M30/M40) permette di affrontare qualsiasi condizioni di lavoro.

Il rivestimento si presenta di color giallo chiaro.

888X - ISO P30/P35/P40/P50/M20/M30

Qualità con elevato grado di tenacità composta da una particolare granulometria del carburo di tungsteno, in grado di far fronte a quelle lavorazioni meccaniche ove siano coinvolti forti urti e vibrazioni anche su macchine non moderne.

Il rivestimento è composto da carburi e carbonitriuri di titanio adatti, in particolare, per la lavorazione degli acciai, basse velocità di taglio e alti avanzamenti.

666S - ISO P30/P40/P45/P50

Spessore del rivestimento di ~2,5 micron con un sottostato molto tenace adatto per fresatura sia di acciaio inossidabile che per lavorazioni a basse velocità di taglio e alti avanzamenti, si contraddistingue proprio per la sua versatilità d'impiego.

333X - ISO P20/P25/P30

This grade is coated with titanium nitrides and carbonitrides or a substrate that has been purposely studied to resist high working temperature.

It falls into the ISO P20/P25/P30 group and is most suitable for mixed working on all types of steel, from carbon steel to alloyed types.

It is highly resistant to wear, due to its ca. 10 micron thick coating, but it is not very tough.

It is therefore not recommended for turning works with high vibrations and shocks.

The coating is light yellow in colour.

666X - ISO P35/P40/P45

This grade is coated with titanium carbides and carbonitrides on a substrate that has been suitably studied to resist high vibrations and stresses, also on old-fashioned machines.

It provides excellent results in general turning works of steel, specially stainless steel and cast iron.

It is really an all purpose quality as its ca. 6 microns thick coating provides high resistance to wear, while a very strong substrate (M30/M40) allows its use under all conditions.

The coating is light yellow in colour.

888X - ISO P30/P35/P40/P50/M20/M30

Characterized by an high degree of toughness, this grade is made of a particular grainsize of the tungsten carbide, which makes it suitable for those machinings with shocks and vibrations, also on old-fashioned machines.

Its coating is composed of titanium carbides and carbonitrides which turn out to be suitable for steel working, particularly at low cutting speeds and with high feed.

666S - ISO P30/P40/P45/P50

Characterized by ca. 2/2.5 microns thick coating and a very tough substrate which proves to be suitable for both stainless steel milling and work processes with low cutting speeds and high feed.

It stands out among many other qualities for its versatility of application.

A99 - ISO P20/P25/P30/K10/K20

Qualità particolarmente adatta per lavorazioni di tornitura e fresatura di ghisa in generale e di acciai ad alta velocità da taglio.

Composta da un sottostrato (M15/M20) con buona resistenza all'usura e rivestita con composti intervallati di ossido di alluminio (Allumina - Al_2O_3) e carburo di titanio (TiC) che conferiscono all'inserto eccezionale proprietà di resistenza all'usura.

Lo spessore del rivestimento è di circa 6 micron ed è di colore grigio scuro. È una qualità abbastanza rigida, quindi si raccomanda l'impiego in condizioni favor evoli ossia senza eccessivi urti o vibrazioni.

A155 - ISO P05/P10/P20/K05/K10/K15

Qualità con altissima resistenza all'usura, ma di scarsa tenacità grazie al suo particolare sottostrato che ne garantisce una lunga durata del tagliente. Si raccomanda l'impiego su macchine a controllo numerico ad alte velocità e basse asportazioni.

Il rivestimento è composto da strati di ossido di alluminio (Allumina - Al_2O_3), carburo di titanio (TiC) e nitruro di titanio (TiN).

A355 - ISO P20/P30/K15/K20

Simile alla precedente qualità per quanto riguarda il tipo di rivestimento ma si differenzia per il sottostrato tenace.

Si raccomanda questa qualità su macchine a controllo numerico ad alte velocità di taglio e medie asportazioni. Grazie alla non eccessiva durezza, si colloca nel campo di applicazione standard P20/P25/P30/K20 facendone così una qualità universale.

Ti25 - ISO P15/P25

Qualità rivestita di carburi e carbonitridi di titanio, impiegata esclusivamente per la realizzazione di inserti adatti alle operazioni di filettatura.

WM130 - ISO G2/G3

Qualità impiegata nella realizzazione di sottoplacchette per inserti.

A99 - ISO P20/P25/P30/K10/K20

This grade can be used with very good results in turning and milling works of cast iron in general and high cutting speed steels.

It is made of a substrate resistant to wear (M15/M20) and coated in turn with aluminium oxide (Alumina Al_2O_3) and titanium carbide (TiC), which give the insert exceptional properties of resistance to wear.

The coating thickness is of ca. 6 micron and looks dark grey in colour.

This is a rather tough grade and therefore its use is recommended in favourable working conditions, that is, when no excessive shock vibrations are present.

A155 - ISO P05/P10/P20/K05/K10/K15

It has excellent wearproof properties, but rather poor toughness. Thanks to both its particular coating and substrate, this grade guarantees a rather long life of the cutting edge. We recommend its use on numeric control machines with high speeds and light chip removal. Its coating is made of aluminium oxide (Alumina Al_2O_3) layers together with titanium carbide (TiC) and titanium nitride (TiN).

A355 - ISO P20/P30/K15/K20

Due to its coating type, this is similar to the previous grade, but it differs from it for its tough substrate.

This grade is recommended on numeric control machines with high cutting speeds and medium chip removal.

Thanks to its not excessive hardness, it falls into standard P20/P25/P30/K20 application field, turning it into an universal grade.

Ti25 - ISO P15/P25

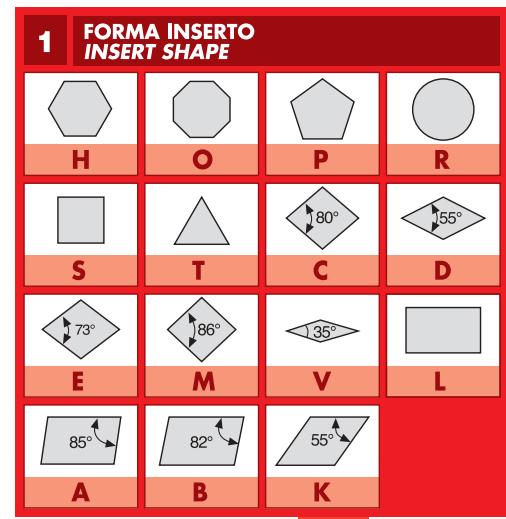

Titanium carbides and carbonitrides coated grade, exclusively used in the manufacture of threading inserts.

WN130 - ISO G2/G3

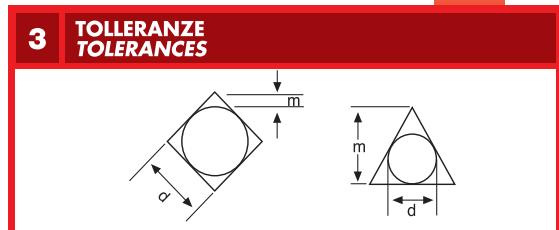

Grade used in the manufacture of shims for inserts.
